

Developing EJBs

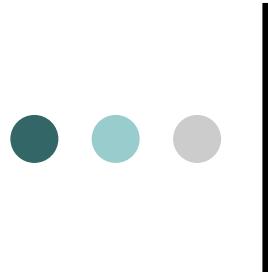

An introduction to the development
cycle of Enterprise Java Beans

Jan Hegewald, 23.11.2004

Agenda

- Choosing a J2EE-Server
- IDEs for the development of EJBs
- Deployment & Packaging
- Useful tools
- Sample application

Developing EJBs

- Choosing a J2EE-Server
- IDEs for the development of EJBs
- Deployment & Packaging
- Useful tools
- Sample application

Choosing a J2EE-Server

○ Commercial Products

- BEA Weblogic
- IBM Websphere Application Server
- Oracle Application Server
- Borland Enterprise Server
- SAP Web Application Server ...

○ Free / Open Source Software

- JBoss
- JOnAS
- Sun Java System Application Server...

<http://www.theserverside.com/reviews/matrix.tss>

JBoss

- Available at <http://www.jboss.org>
 - Microkernel architecture (only needed modules may be used)
 - Administration via web interface
 - Hot deployment even of server services
 - „No compilation“ support
- - Very few documentation freely available and not for most recent release
- + Most popular open source J2EE server and 3rd position in application server market in general (in 2003)
- + Good support available
- + Sun certified J2EE Server

JOnAS

- Available at <http://jonas.objectweb.org>
 - Uses Tomcat or Jetty as servlet container and web server
 - Can also be administrated via web interface
 - Clustering, load-balancing, failover
 - Webservices support based on AXIS
- Less intensive development than on JBoss
- + Very good documentation, tutorials, FAQs available

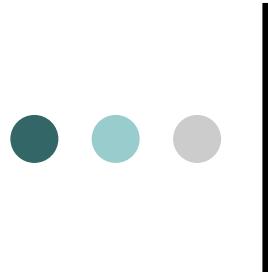

Sun Java System Application Server

- Available at: <http://java.sun.com/j2ee>
- Commercial product, platform edition available freely
- Can be used with Java Application Verification Kit
 - Really slow and resource-demanding
 - + Reference implementation ⇒ strictly implements J2EE specification
 - + Only server that supports JSF

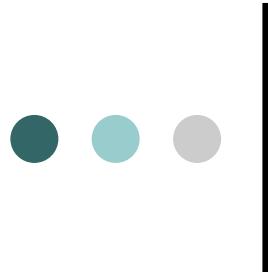

Choosing a J2EE-Server

- In fact, switching the server of an existing application is not possible without effort:
 - Vendor-dependent deployment descriptors
 - Minor changes to code necessary

Developing EJBs

- Choosing a J2EE-Server
- IDEs for the development of EJBs
- Deployment & Packaging
- Useful tools
- Sample application

IDEs for the development of EJBs

- Commercial Products
 - IntelliJ IDEA
 - Sun Java Studio Enterprise
 - IBM Websphere Studio Application Developer
 - ...
- Free / Open Source Software
 - Eclipse
 - NetBeans (planned for 4.1)
 - Oracle JDeveloper

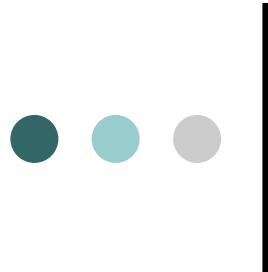

Eclipse

- Eclipse can be used for developing J2EE applications by using plugins
 - Lomboz:
 - XDoclet supported
 - May be used to control J2EE servers
 - Supports deployment
 - JOPE (JOnAS plugin for Eclipse)
 - Beta-stadium
 - JBoss IDE:
 - Code wizards
 - XDoclet very well integrated
 - Packaging support
 - Deployment support
 - Offers control of JBoss AS
 - Debugging of applications

Oracle JDeveloper

- Click 'n play development:
 - Includes UML modeling and visual page flow diagrammer for Struts
 - Entity beans can be created by dragging a table from the DB to the UML model
 - Draging entity beans into JSP creates all relevant fields
- Professional Profiler
- Optimal when using Oracle DB

Developing EJBs

- Choosing a J2EE-Server
- IDEs for the development of EJBs
- **Deployment & Packaging**
- Useful tools
- Sample application

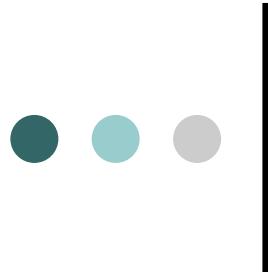

Deployment Descriptor

- Deployment Descriptor: /META-INF/ejb-jar.xml
- Used to
 - configure beans (section <enterprise-beans>)
 - assemble the whole application (section <assembly-descriptor>)
- DTD in EJB 2.0, XML Schema in EJB 2.1
- No longer needed in EJB 3.0

Bean configuration

- Names bean interfaces
- Describes bean attributes:
 - CMP vs. BMP
 - SFSB vs. SLSB
 - Persistence details
 - ...
- Describes cross-references

Example bean configuration

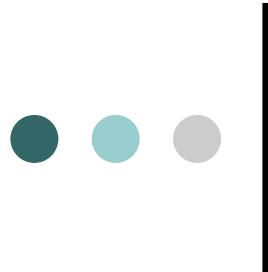

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE ejb-jar PUBLIC "-//Sun Microsystems, Inc.//DTD Enterprise JavaBeans 2.0//EN"
 "http://java.sun.com/dtd/ejb-jar_2_0.dtd">

<ejb-jar >
  <enterprise-beans>

    <session >
      <description><![CDATA[Session bean that implements business processes]]></description>
      <display-name>BookShop Bean</display-name>

      <ejb-name>BookShop</ejb-name>

      <home>example.interfaces.BookShopHome</home>
      <remote>example.interfaces.BookShop</remote>
      <ejb-class>example.ejb.BookShopBean</ejb-class>
      <session-type>Stateless</session-type>
      <transaction-type>Container</transaction-type>
      <ejb-ref >
        <ejb-ref-name>ejb/Book</ejb-ref-name>
        <ejb-ref-type>Entity</ejb-ref-type>
        <home>example.interfaces.BookHome</home>
        <remote>example.interfaces.Book</remote>
        <ejb-link>Book</ejb-link>
      </ejb-ref>
    </session>
  </enterprise-beans>
```

Assembly configuration

- Configures security service
 - Roles
 - Permissions
- Configures transaction service
- May be used to configure message destinations

Example assembly configuration

```
<assembly-descriptor>
    <security-role>
        <role-name>jaas</role-name>
    </security-role>
    <method-permission>
        <role-name>jaas</role-name>
        <method>
            <ejb-name>JAASOp</ejb-name>
            <method-name>*</method-name>
        </method>
    </method-permission>
    <container-transaction>
        <method>
            <ejb-name>JAASOp</ejb-name>
            <method-name>*</method-name>
        </method>
    </container-transaction>
</assembly-descriptor>
</ejb-jar>
```

Packaging

- JAR (Java-Archive): contains libraries, clients, beans, ...
- WAR (Web-Archive): contains libraries, servlets, JSPs, ...
- EAR (Enterprise-Archive): contains J2EE components (beans + clients)

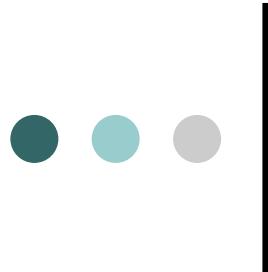

Packaging

- META-INF/application.xml: describes components in an enterprise archive

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE application PUBLIC "-//Sun Microsystems, Inc.//DTD J2EE Application
1.3//EN" "http://java.sun.com/dtd/application_1_3.dtd">
<application>
    <display-name>Bookshop Application</display-name>
    <module>
        <ejb>BookEJB.jar</ejb>
    </module>
    <module>
        <web>
            <web-uri>BookWeb.war</web-uri>
            <context-root>/book</context-root>
        </web>
    </module>
</application>
```

Developing EJBs

- Choosing a J2EE-Server
- IDEs for the development of EJBs
- Deployment & Packaging
- **Useful tools**
- Sample application

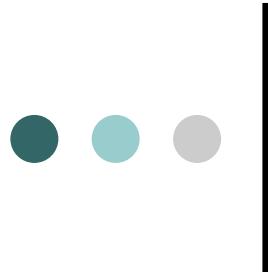

XDoclet

- Two main functions:
 - Generates code
 - Generates deployment descriptors and vendor-specific configuration files
- Descriptive: uses JavaDoc-like meta-tag annotations
- Works like Ant

Sun J2EE Application Verification Kit

- Tool that verifies whether an application conforms to the J2EE platform specification
 - Static verification: verifies deployment descriptors
 - Dynamic verification: runtime profiling of J2EE applications
- ⊖ Requires application to run in Sun AS
- ⊖ Does not verify Message-driven beans and Servlet filters

UML2EJB

- Code generator
- Creates EJBs with XDoclet tags from UML model from a case tool

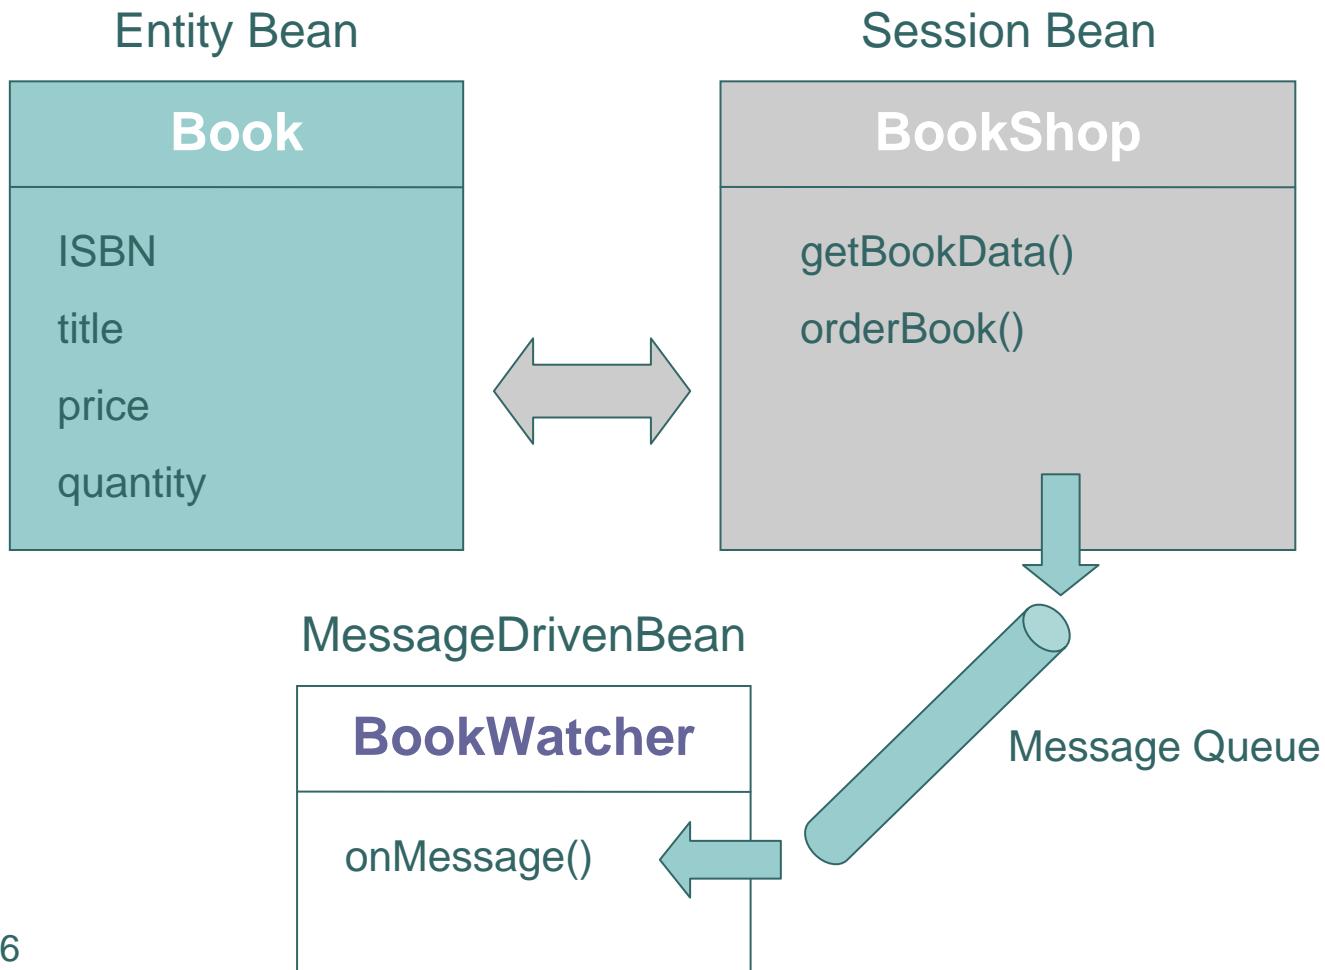

- ⊖ JDeveloper can do the same
- ⊖ No longer under development, version 1.3.1 is latest

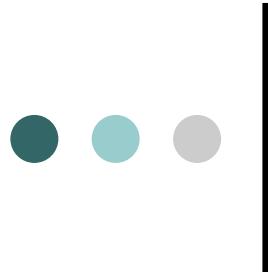

Developing EJBs

- Choosing a J2EE-Server
- IDEs for the development of EJBs
- Deployment & Packaging
- Useful tools
- Sample application

Sample Application - Architecture

Sample Application - Environment

- JBoss AS
- Eclipse with JBoss-IDE
- XDoclet via JBoss-IDE
- MySQL as database
